

Nuxt Project

...

Brianna Clark and Rohan Kamat

What is NUXT?

- **Framework** for building web applications
- Built off of **VUE.js**
- Allows it to be a **full stack** web application
 - Routing
 - Data Fetching
 - Caching
 - Development
 - Testing
- Enjoyed the site that we made with REACT
 - How would it look in NUXT?

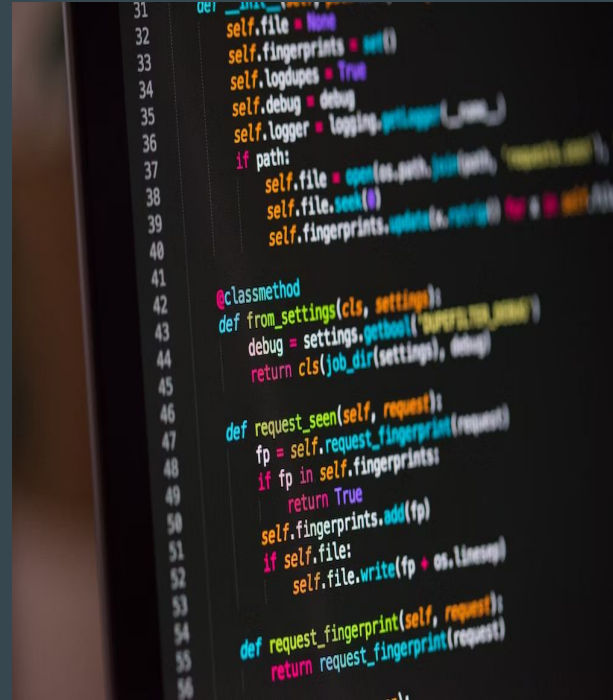

What is Vue?

- JavaScript Framework
 - Used language inside of NUXT
 - Tool to develop **frontend** UI
 - Allows for
 - **Component** based structure
 - Encapsulates HTML, CSS, JavaScript
 - Reactive data binding

Project Structure Differences:

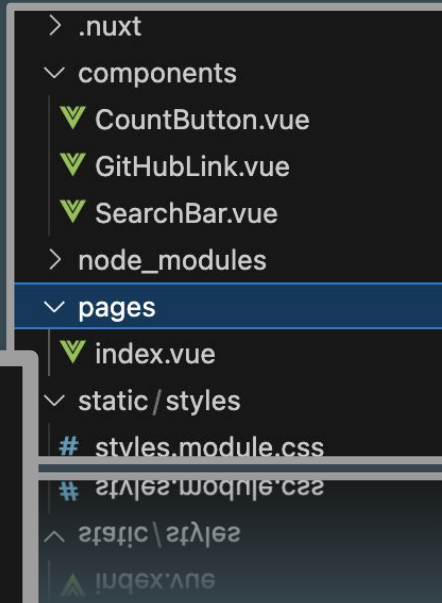

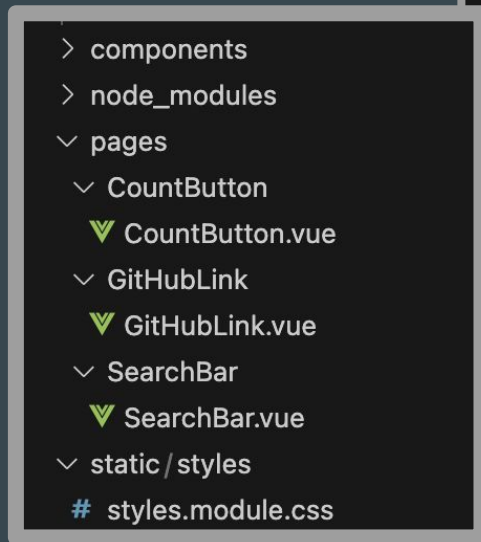

- Nuxt/Vue
 - **Predefined structure** for a full stack project using Vue/Nuxt
 - The **pages** directory
 - The **components** directory
 - Crucial role in setting up the order and the structure of your website and allowing for code reusability.

```
31 self.file = None
32 self.fingerprints = set()
33 self.logdupes = True
34 self.debug = debug
35 self.logger = logging.getLogger(__name__)
36 if path:
37     self.file = open(os.path.join(path, 'requests.log'),
38                     self.file.seek(0)
39     self.fingerprints.update(re.findall(r'(?P<ip>[0-9.]+)', line)))
40
41
42 @classmethod
43 def from_settings(cls, settings):
44     debug = settings.getbool('DEBUG', False)
45     return cls(job_dir(settings), debug)
46
47 def request_seen(self, request):
48     fp = self.request_fingerprint(request)
49     if fp in self.fingerprints:
50         return True
51     self.fingerprints.add(fp)
52     if self.file:
53         self.file.write(fp + os.linesep)
54
55 def request_fingerprint(self, request):
56     return request_fingerprint(request)
```

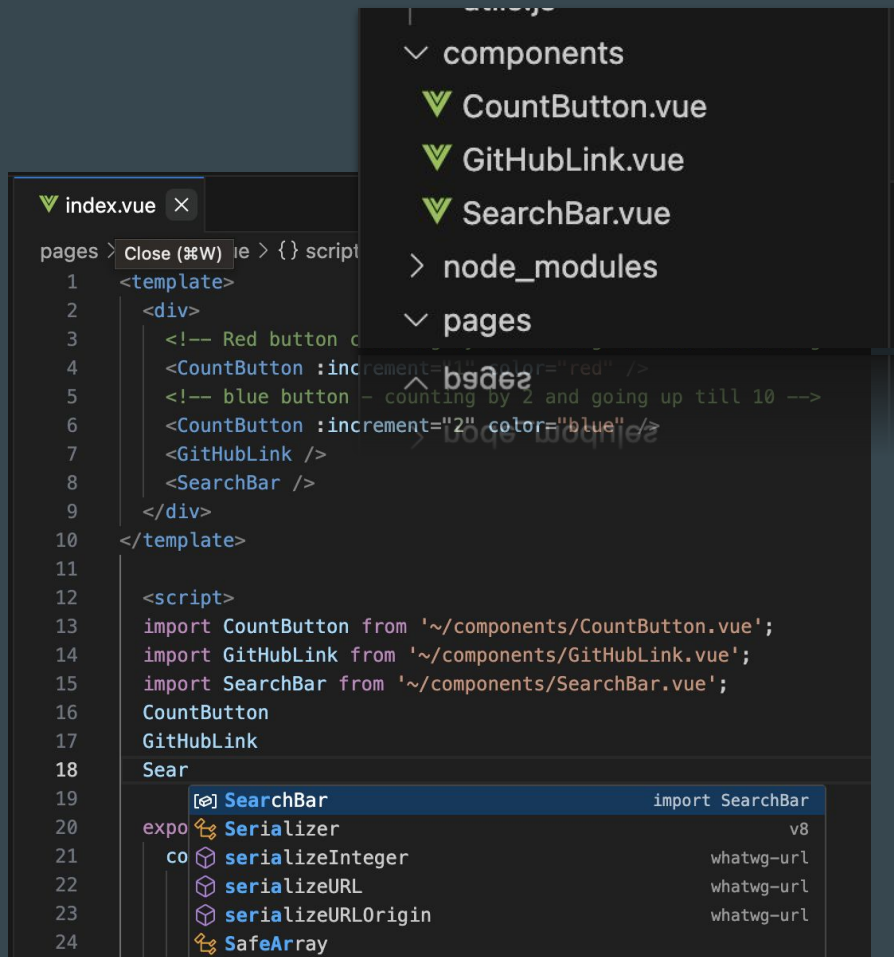

Pages inside of Nuxt

- Directory inside of Nuxt
 - Underneath the pages folder we can define the different **paths** for the website.
 - Individual VUE files are registered as **different pages** if under the pages directory.

Components inside of Nuxt

- Directory
 - This where you place **reusable code**
 - That way that you can refer to it throughout the rest of the code
 - Instead of having to import it, you can refer to the **component name**.

Styling

- React
 - Similar to Html
- Nuxt
 - Nuxt.js encourages the use of **scoped styling**
 - Helps things become more clearer
 - Less issue of cascading style sheets
 - Styling SCOPED to this component and not others.

▼ SearchBar.vue ×

components > ▼ SearchBar.vue > {} script > [🔗] default > 📎 methods

```
52
53 <style scoped>
    1 reference
54   .productsContainer {
55     display: flex;
56     flex-wrap: wrap;
57     justify-content: space-around;
58     max-width: 1200px;
59     margin: 0 auto;
60   }
61
    1 reference
62   .product {
63     width: 200px;
64     border: 2px solid ■ darkgray;
65     margin: 10px;
66     padding: 8px;
67     text-align: center;
68     border-radius: 8px;
69     overflow: hidden;
70   }
71
    1 reference
72   .product img {
73     max-width: 100%;
74     max-height: 100%;
75     object-fit: contain;
76     border-radius: 6px;
77   }
78 </style>
79
```

Full Stack

- Nuxt handles the **Client** and the **Server**.
- **Automatically re-compiles** as you make changes to the code.

```

Something familiar...

- NUXT still uses **npm**...
- Very similar to react project...

Run:

- \$ npm run build
- \$ npm run start
- \$ npm run dev

Placed the project on a **specified port**.

`{}` package.json ×

`{}` package.json > `{}` scripts > `start`
